

## Declaration on the use of nanomaterials at Duplex

Nanoparticles are solid particles with a size of less than 100 nanometres (nm). The prefix nano refers to a scale of billionths, in other words a nanometre is a billionth of a metre or a millionth of a millimetre. There are many and varied ways in which nanomaterial can be used. In certain applications nanomaterials offer the prospect of benefits for mankind and for the environment. However, the possible risks inherent in nanomaterials have not yet been conclusively researched. Duplex has consequently issued the following declaration:

Duplex products are nanomaterials free.

Duplex products do not produce nanoparticles

This compliance is claimed at the time of the statement by examination of the products in relation to their construction and the materials used.
